SAP Consulting for Utilities

SAP Optimization for Nuclear Facilities

HPC America delivers an unrivalled breadth and depth of services and solutions for nuclear facilities. While the typical consultant stops after making recommendations, our techno-functional experts have the right skills and experience to manage SAP projects from conception through implementation and ongoing support.

We're able to provide nuclear facilities with such comprehensive service for three primary reasons. We have worked with nuclear plants for many years, and understand the business processes that are critical to successful operations. We only hire the best SAP Solution Architects and ABAP Developers. And our team communicates with yours in plain English, focusing on functionality instead of technology.

HPC's Benefits for Nuclear Facilities

Proven process from assessment through go-live. HPC's team is comprised of utility industry experts who also know SAP intimately. By combining our personal experience working with nuclear facilities and our extensive ABAP development skills, we're able to simplify and automate processes that are complex, manual, and time intensive.

Easier compliance with regulations. For nuclear facilities on SAP, strict compliance to Nuclear Regulatory Commission (NRC) requirements can be challenging when trying to develop printed output from SAP. We eliminate this difficulty by producing NRC-compliant shop papers from SAP using Smartforms and our own advanced, custom embedded code. We have proven expertise in making shop paper outputs conform to any plant requirements, such as signatures, page breaks, and separation for tasks.

Seamless integration with third-party applications. HPC America's integration services connect SAP seamlessly with popular third-party applications, to aid work management functionality for generation, transmission and distribution, and customer care and services. Some of our recent work has involved integrating SAP with Primavera for project scheduling, Ventyx eSOMS for plant operations, and BEA infrastructure software.

Greater cost efficiencies. We can help make your operations more efficient in many ways, by automating traditionally complex, manual processes, simplifying the end-user experience, enhancing workflow and communication, and reducing the complexity of important business processes. From Supply Chain to Work Management and Work Orders, HPC's nuclear facility consultants can transform half-day procedures into simple tasks that run over a coffee break.

Enhanced procurement and supply chain management. Our procurement and supply chain management knowledge for nuclear facilities is legendary. We've helped clients configure SAP to prepare for major refueling outages by leveraging the planning tools in SAP SCM. Our Nuclear Analytics module provides real-time reporting in ERP to keep plant managers informed every minute during a planned outage. There's no waiting for business intelligence reporting that could result in the loss of precious time; we make information both timely and pervasive, so that you stay informed.

About HPC America

HPC America is a utility industry expert with more than 15 years of experience implementing SAP and developing back-office solutions in accounting, customer billing, supply chain management, and business intelligence specifically for utilities large and small. We are an SAP software and services partner, and work with all SAP IS-Utility solutions from IS-U/FERC to CCS and Work Clearance.

HPC America is also the original developer of the FERC module, which SAP acquired in 1996. Since then, we have been intimately involved in its implementation and maintenance at more than a dozen utilities throughout the United States. Our customers include Pacific Gas & Electric, Navajo Tribal Utility Authority, Tacoma Public Utilities, Oklahoma Gas & Electric, Puget Sound Energy, Wisconsin Electric, and Arizona Electric Power Cooperative.
